

HAIR REMOVAL

The treatment is performed using the latest laser technology to remove hair with a minimum of pain, inconvenience and side effects.

The laser light is able to pass - unaffected - through the outer layers of the skin and reach the deep hair follicle. At the follicle, the laser energy is absorbed and transformed into heat that disables the follicle. As a result, hair growth is impaired without affecting the surrounding tissue.

The result is a safer, faster and more effective way to eliminate unwanted hair.

A BETTER METHOD

Until now, electrolysis has provided the only long term method for the elimination of unwanted hair. During electrolysis, a needle is inserted into each hair follicle. Removing one hair at a time, this process is tedious. It can take months or years of treatments to achieve a satisfactory result. The effectiveness is also dependent on the skill of the electrolysis.

Less permanent methods include shaving, plucking and waxing.

Shaving is the most common method of hair removal. Virtually everyone owns a razor, but shaving only lasts a few days and requires a constant commitment to maintain a hair-free appearance.

Plucking leads to a more attractive and longer lasting result than shaving, but is quite painful. Except for small areas, plucking is tedious and impractical.

Waxing is similar to plucking, but it can treat large areas. Like plucking, the process of waxing may be painful and can also cause allergic reactions and/or inflammation of the hair follicle.

WHAT DISTINGUISHES LASER FROM OTHER METHODS OF HAIR REMOVAL!

The laser uses pulses of light to target the hair follicle. The laser has been designed to treat only the hair follicle while leaving the surrounding tissue unaffected.

WHAT MIGHT YOU EXPECT

The treatment consists of a series of laser pulses, that emit a tingling feeling or warming sensation... Within thirty minutes of treatment, the area may become pink or red, and may feel like a sunburn for a day or so.

Because the Laser does not damage the skin, no bandages are necessary.

LENGTH OF TREATMENT

Each laser pulse treats about one-half inch area, which can contain ten or more hairs. The amount of time needed depends on the size of the area to be treated. The lip usually takes a few minutes. Other areas, such as the leg, may take longer.

NUMBER OF TREATMENTS

The laser works by disabling hair follicles that are actively producing hair at the time of treatment. At any time, some hair follicles are dormant. Since the follicles are producing hair at different times, several visits may be necessary for the total treatment. Your physician will work with you to develop the optimal treatment strategy.

THE ADVANTAGE OF TREATMENT FOR HAIR REMOVAL

Over the Years, various methods have been used to remove unwanted hair: shaving, waxing, depilatory creams. But these methods only remove hair temporarily.

Electrolysis offers some long-term hair removal, but takes years of treatment and innumerable sessions. Since it requires the placement of a needle in each hair follicle, the procedure is tedious and impractical for treating large areas.

At last, a new laser treatment which provides long-term hair removal for large and small areas, without the difficulties and commitment involved in other methods. And it's available right here in this facility. This new procedure by Cosmedx Comfort LLC offers an alternative and many added benefits.

- Fewer treatments required

- Suitable for large areas

- Accuracy

Unlike the electrolysis needle, laser light can't "miss" a target hair follicle

- Greater "coverage"

Each laser pulse treats several follicles at the same time. Electrolysis treats one hair at a time.

- Non-invasive

No risk of needle transmitted disease.

- Shorter course of treatment

Electrolysis can take up to five years to clear both legs.
